In both approaches and throughout the text, IT is considered an integral part and enabler of internal control. The second edition of Accounting Information Systems and Internal Control: Places internal control in the context of other related disciplines. Discusses contemporary developments in the field of internal control. Explores the relationship between internal control and management control as means to achieve organizational control. Examines the dynamics of internal control and IT. Provides tools and techniques for documenting and evaluating internal control systems. Discusses the process approach to designing and evaluating internal control systems. Introduces the contemporary typology approach to designing and evaluating internal control systems, focusing on internal controls that are applicable in various types of organization, including trade, production, service (including knowledge intensive firms and telecoms), financial industry and governmental organizations. Illustrates practical internal control issues using articles from several major international newspapers such as the Financial Times, the Guardian, The New York Times and the Washington Post. Based on a ten-year examination of control systems in over 50 U.S. businesses, this book broadens the definition of control and establishes a critical bridge between the disciplines of strategy and accounting and control. In addition to the more traditional diagnostic control systems, Simons identifies three new control systems that allow strategic change: belief systems that communicate core values and provide inspiration and direction, boundary systems that frame the strategic domain and define the limits of freedom, and interactive systems that provide flexibility in adapting to competitive environments and encourage organizational learning. These four control systems, according to Simons, will provide managers with the basic levers for pursuing strategic objectives.

Enterprise Information Systems: A Pattern Based Approach, 3e, by Dunn/Cherrington/Hollander presents a pattern-based approach to designing enterprise information systems with a particular emphasis on the enterprise-wide database. This edition is built on the idea that a separation between accounting information systems and management information systems should not exist. We believe patterns help people see the "big picture" of enterprises more clearly and therefore help design better systems. We believe you cannot identify anything that we need to account for that we do not also need to manage; nor can we identify anything we need to manage that we do not also need to account for. In this edition, we will show how a well-designed REA-based Accounting Information System is the Enterprise Information System.

Inhaltsangabe:Abstract: The world economy has undergone enormous changes since the late 1980s. The trend of globalisation has more and more integrated societies and linked continents with one another. The result has been the development of free trade areas such as NAFTA (North American Free Trade Area), the EU customs union, and emerging markets in Asia. Countries had to cope with this development of a near free market economy and higher competition. Governments introduced new laws and regulations and great reforms and adjustments had to be made. The effects of the above led to great impacts on general business and the entire world economy. Companies started to enter new markets. To link all its facilities and office buildings and factories, the Intranet was established. Wwith such an efficient LAN network, all the offices of a worldwide operating organization were linked with the central computer system of the company’s headquarters and data and information was easily accessible. At the same time, PC users discovered the Internet leading to a worldwide revolution and to the so-called Information Age. The Internet has experienced tremendous growth during the last few years in the western world and companies started to introduce their own web sites on the Internet. Basically, everyone had access to these company sites and firms started to advertise themselves and to offer their products and services online and developed new marketing concepts in the e-commerce business. At the same time the telecommunication industry was booming. Online providers and mobile telecommunications companies experienced fast and significant growth due to the World Wide Web, deregulation and lower prices. The New Economy was born and companies came into existence like Yahoo! and Amazon.com, and so many more creating millions of new high-tech jobs, especially in the United States and later on also in Europe. Demand for personal computers and servers have increased dramatically. The hardware needed had to be provided, which created another boom in the industry. Chipmakers like Intel and AMD became successful global players and new technologies were introduced at an ever-faster speed. At the same time the global economy brought up new start up companies onto the market, which are producing other important components of computers like modems and video and networking cards and high speed cables. Software companies introduced new programs needed, creating new high-income [...]
