*This anthology brings together voices from industry and academia in a call for elevating the status, identity, value, and influence of technical communicators. Editors Barbara Mirel and Rachel Spilka assert that technical communicators must depart from their traditional roles, moving instead in a more influential and expansive direction. To help readers explore the possibilities, contributions from innovative thinkers and leaders in technical communication propose ways to redefine the field's identity and purposes and to expand the parameters of its work. The chapters included here all point toward new directions for greater growth and influence of the field. Contributors depart from traditional ideas and solutions and discuss new and in some cases radical points, provoking further thought and discussion. Its exploration of fresh territory uncovers new research topics and directions, and provides an examination of both internal, industry-academia relationships and external relationships between technical communicators and other professionals. In its entirety, this collection represents an inclusive vision for the future, targeting such wide-ranging issues as creating effective professional organizations, disseminating research to diverse audiences, transitioning to more influential job roles, exerting leadership in usability, and creating hybrid identities and collaborative programs between industry and academic to support them. The diverse voices from industry and academia will inspire readers to think differently about the discipline's identity and direction, and to build on the ideas they find herein to effect change within their own spheres. As required reading for academics and professionals in technical communication, this collection is a critical step in reshaping and reinvigorating the technical communication field to ensure its survival and growth in the 21st century.*

*An oft-repeated adage among telecommunication providers goes,*

*“There are ve things that matter: reliability, reliability, reliability, time to market, and cost. If you can’t do all ve, at least do the rst three. ” Yet, designing and operating reliable networks and services is a Herculean task. Building truly reliable components is unacceptably expensive, forcing us to c- struct reliable systems out of unreliable components. The resulting systems are inherently complex, consisting of many different kinds of components running a variety of different protocols that interact in subtle ways. Inter-networkssuch as the Internet span multiple regions of administrative control, from campus and cor- rate networks to Internet Service Providers, making good end-to-end performance a shared responsibility borne by sometimes uncooperative parties. Moreover, these networks consist not only of routers, but also lower-layer devices such as optical switches and higher-layer components such as rewalls and proxies. And, these components are highly con gurable, leaving ample room for operator error and buggy software. As if that were not dif cult enough, end users understandably care about the performance of their higher-level applications, which has a complicated relationship with the behavior of the underlying network. Despite these challenges, researchers and practitioners alike have made tremendous strides in improving the reliability of modern networks and services.*

**As a result of resumption of sovereignty over Hong Kong and Macao as well as the uncertain relationship between the Mainland and Taiwan, China has become a country composed of peculiar political compounds, resulting in four independent jurisdictions. This makes inter-regional legal cooperation a complicated yet compelling topic. Divided into five parts, this book considers possible solutions to problems in China’s inter-regional cross-border insolvency cooperation. These solutions are developed on the basis of two groups of comparative studies, including comparison among the cross-border insolvency systems of the four independent jurisdictions in China and comparison between EU Insolvency Regulation and the UNCITRAL Model Law. The author discusses the advantages and disadvantages of the two systems and presents original recommendations for the way forward. The book will be**

**a valuable resource for academics and policy makers in insolvency law, Asian law and comparative law.**

**The transportation of multimedia over the network requires timely and errorless transmission much more strictly than other data. This had led to special protocols and to special treatment in multimedia applications (telephony, IP-TV, streaming) to overcome network issues. This book begins with an overview of the vast market combined with the user's expectations. The base mechanisms of the audio/video coding (H.26x etc.) are explained to understand characteristics of the generated network traffic. Further chapters treat common specialized underlying IP network functions which cope with multimedia data in conjunction with special time adaptation measures. Based on those standard functions these chapters can treat uniformly SIP, H.248, High-End IP-TV, Webcast, Signage etc. A special section is devoted to home networks which challenge high-end service delivery due to possibly unreliable management. The whole book treats concepts described in accessible IP-based standards and which are implemented broadly. The book is aimed at graduate students/practitioners with good basic knowledge in computer networking. It provides the reader with all concepts of currently used IP technologies of how to deliver multimedia efficiently to the end user.**

This book is the integrated presentation of a large body of work on understanding the operation of biological brains as systems. The work has been carried out by the author over the last 22 years, and leads to a claim that it is relatively straightforward to understand how human cognition results from and is supported by physiological processes in the brain. This claim has roots in the technology for designing and manufacturing electronic systems which manage extremely complex telecommunications networks with high reliability, in real time and with no human intervention. Such systems perform very large numbers of interacting control features. Although there is little direct resemblance between such systems and biological brains, the ways in which these practical considerations force system architectures within some specific bounds leads to an understanding of how different but analogous practical considerations constrain the architectures of brains within different bounds called the Recommendation Architecture. These architectural bounds make it possible to relate cognitive phenomena to physiological processes.
