A complete guide to selection and use of the best reagents for a wide range of transformations This book is the updated and expanded Second Edition of Jacqueline Seyden-Penne's practical guide to selection of reducing reagents in organic synthesis. It is an indispensable working resource for organic synthetic chemists-the only reference focusing exclusively on aluminohydrides and borohydrides and their derivatives. Simple to use, it is organized according to specific reductions so that chemists can more easily match the best reagent to a given transformation. Throughout, Dr. Seyden-Penne emphasizes four crucial categories: compatibility, possibilities for partial reduction, the regio- and stereoselectivity of reductions that are altered or controlled by neighboring groups, and asymmetric reductions. Extremely well-referenced, *Reductions by the Alumino- and Borohydrides in Organic Synthesis* provides the most up-to-date, detailed coverage of: * Successful techniques for performing highly selective reductions * Chemo-, regio-, stereo-, and enantioselective reductions of both simple and complex compounds * Best methods for obtaining the main functional groups by hydridereduction, provided in quick-reference tabular form * New and more selective reagents developed within the last five years * Experimental conditions, including solvent and temperature, and yields for most cases described.

Written by leading authors in the field. Packed with original cases that connect key concepts, this book provides students with core tools and techniques to enable them to design and implement a successful operations strategy. Built on sound academic research and industry best-practice this is an invaluable resource for all students.

This handbook covers new methodological developments and applications of relativistic quantum chemistry. It also pays attention to the foundation of relativistic quantum mechanics and addresses a number of fundamental issues that have not been covered by any book. For instance, what is the appropriate relativistic many-electron Hamiltonian? How to do relativistic explicit/local correlation? How to formulate relativistic properties? How to combine double-group and time-reversal symmetries? How to do QED calculations for molecules? Just to name a few. This book aims to establish the big picture of relativistic molecular quantum mechanics, ranging from pedagogic introduction for uninitiated readers, advanced methodologies and efficient algorithms for experts, to possible future perspectives, such that the reader knows when/how to apply/develop the methodologies. This self-contained two-volume book can be regarded as a supplement to the three-volume "Handbook of Computational Chemistry", which contains no relativity at all. It is to be composed of 6 sections with different chapters (will be further expanded), each of which is to be written by the most active experts, who will be invited upon approval of this proposal.

This book provides readers with an up-to-date and comprehensive view on the resolution of inflammation and on new developments in this area, including pro-resolution mediators, apoptosis, macrophage clearance of apoptotic cells, possible novel drug developments.

The Supply Chain concept is one of the most important ideas to emerge in management research and practice in the last twenty five years. Organizations do not exist in isolation. Any organization, whether a large corporation, public body, or small business, which aims to meet the needs of its various customers and stakeholders will need resources in order to do this, and will acquire many of its materials, equipment, and supplies from other organizations. The performance of an organization is thus influenced to a greater or lesser degree by the actions of the organizations that make up the Supply Chain. There is no doubt that the emergence of Supply Chain Management has been a major development in management thinking and practice. It has become an established feature of management education, and a professional field with its own magazines and journals - a field with its own distinctive perspectives. However, many writers observe that it is a field characterized by imprecise terminology, sloppily applied metaphors, and conflated or confused concepts. The slightest skim of the many literatures that use the term reveals a wide range of interpretations, hundreds of different formulations, nuances, and taxonomies for the 'Supply Chain', and dozens of near synonyms. The purpose of this volume is to bring together insights from the leading researchers and thinkers on supply chain management to help move the field forward. It provides a survey of the key theoretical concepts which underpin the field, and presents critical evaluations of the underlying ideas and approaches. It will be an important resource for those active in researching in or applying the ideas of supply chain management, and for advanced students and their teachers.

What does it mean to bring progress—schools, electricity, roads, running water—to paradise? Can our consumer culture and desire to “do good” really be good for a community that has survived contentedly for centuries without us? In October 2008, climbing expedition leader and attorney, Jeffrey Rasley, led a trek to a village in a remote valley in the Solu region of Nepal named Basa. His group of three adventurers was only the third group of white people ever seen in this village of subsistence farmers. What he found was a people thoroughly unaffected by Western consumer-culture values. They had no running water, electricity, or anything that moves on wheels. Each family lived in a beautiful, hand-chiseled stone house with a flower garden. Beyond what they already had, it seemed all they wanted was education for the children. He helped them finish a school building already in progress, and then they asked for help getting electricity to their village. Bringing Progress to Paradise describes Rasley’s transformation from adventurer to committed philanthropist. We are attracted to the simpler way of life in these communities, and we are changed by our experience of it. They are attracted to us, because we bring economic benefits. Bringing Progress to Paradise offers Rasley’s critical reflection on the tangled relationship between tourists and locals in “exotic” locales and the effect of Western values on some of the most remote locations on earth.

This exciting new textbook provides exceptional coverage of the essential topics taught in a modern operations management course. Its highly current coverage includes contemporary and relevant service theory and applications. Appropriate manufacturing applications and theory are included where relevant. The book's modern/strategic approach addresses OM from a cross-functional perspective, which views operations as linked to all other functional areas of an organization, such as marketing and finance. The strategic approach takes into consideration the integration of technology and how it changes the way a firm operates. Recognition of this current trend is the main differentiating factor for this Collier/Evans text. The book provides equal coverage of manufacturing and services theory and applications, while placing an emphasis on the integration of the value chain.

An application of differential forms for the study of some local and global aspects of the differential geometry of surfaces. Differential forms are introduced in a simple way that will make them attractive to "users" of mathematics. A brief and elementary introduction to differentiable manifolds is given so that the main theorem, namely Stokes' theorem, can be presented in its natural setting. The applications consist in developing the method of moving frames expounded by E. Cartan to study the local differential geometry of immersed surfaces in R3 as well as the intrinsic geometry of surfaces. This is then collated in the last chapter to present Chern's proof of the Gauss-Bonnet theorem for compact surfaces.

Readers benefit because the book is based on these three themes: (1) it builds an understanding of concepts based on information the reader has previously learned; (2) it helps stress the relationship between conceptual understanding and problem-solving approaches; (3) the authors provide numerous examples and problems that use realistic values and situations to give users a strong foundation of engineering practice. The book also includes a PSpice Supplement which contains problems to teach readers how to construct PSpice source files; and this PSpice Version 9.2 can be used to solve many of the exercises and problems found in the book. Topical emphasis is on the basic techniques of circuit analysis! Illustrated via a Digital-to-Analog Resistive Ladder (Chapter 2); the Flash Converter (Chapter 4); Dual Slope Analog-to-Digital Converter (Chapter 5); Effect of parasite inductance on the step response of a series RLC circuit (Chapter 6); a Two-Stage RC Ladder Network (Chapter 8); and a Switching Surge Voltage (Chapter 9). Photonics of biopolymers discusses the processes of energy transformation in photoexcited proteins, nucleic acids, membranes and model systems. The author addresses, among other topics: Light absorption, screening and reabsorption; photometric studies of protein; energy transfer mechanics; fluorescent probes; photomodulation of enzymes, and photoactivation. Much of the information stems from the author's own wide experience in the field.
