The official book on the Rust programming language, written by the Rust development team at the Mozilla Foundation, fully updated for Rust 2018. The Rust Programming

Language is the official book on Rust: an open source systems programming language that helps you write faster, more reliable software. Rust offers control over low-level details (such as memory usage) in combination with high-level ergonomics, eliminating the hassle traditionally associated with low-level languages. The authors of The Rust Programming Language, members of the Rust Core Team, share their knowledge and experience to show you how to take full advantage of Rust's features--from installation to creating robust and scalable programs. You'll begin with basics like creating functions, choosing data types, and binding variables and then move on to more advanced concepts, such as:

- Ownership and borrowing, lifetimes, and traits
- Using Rust's memory safety guarantees to build fast, safe programs
- Testing, error handling, and effective refactoring
- Generics, smart pointers, multithreading, trait objects, and advanced pattern matching
- Using Cargo, Rust's built-in package manager, to build, test, and document your code and manage dependencies
- How best to use Rust's advanced compiler with compiler-led programming techniques

You'll find plenty of code examples throughout the book, as well as three chapters dedicated to building complete projects to test your learning: a number guessing game, a Rust implementation of a command line tool, and a multithreaded server. New to this edition: An extended section on Rust macros, an expanded chapter on modules, and appendixes on Rust development tools and editions.

Il cospicuo e crescente corpus normativo nazionale e comunitario europeo spinge verso

un incremento dell'efficienza energetica ma continua a non affrontare con la necessaria decisione il ruolo che le nuove tecnologie edilizie possono giocare in questo contesto. Questo tema è stato specificatamente esaminato in uno studio di "rilevante interesse nazionale" (PRIN) – coordinato dall'Università degli Studi di Palermo, con la partecipazione delle università di Torino, Venezia, Pisa e Reggio Calabria – i cui risultati sono stati raccolti nel presente testo. Il volume, dopo un'attenta disamina delle principali normative in materia di efficienza energetica, affronta: a) la classificazione della qualità ambientale indoor nell'ambito del nuovo panorama normativo e di standard per il comfort; b) l'influenza sui consumi energetici degli edifici del livello di comfort degli occupanti, anche con riferimento ai modelli di simulazione che analizzano il comportamento termico degli edifici in regime estivo; c) l'analisi delle nuove tecnologie oggi disponibili per un'edilizia sostenibile, con riferimento agli impianti ad alta efficienza, alle facciate ventilate, alle coperture a verde, ecc.; d) la compatibilità ambientale nel processo di certificazione, anche con riferimento all'istituendo marchio Ecolabel per gli edifici e agli strumenti utilizzabili per la certificazione e l'autovalutazione di tali innovativi edifici.
